SOLSOFT
SOFTWARE DEVELOPMENT

QUALITY, KNOWLEDGE, EXPERIENCE

Dear Sirs,

We are owners of Solsoft, an IT company, which has been operating in the Polish market since 2007.

At the very beginning, we set for ourselves the goal of combining two fields in one enterprise - IT consulting for companies and design/ implementation of complete IT solutions. In this way, we can offer our customers a comprehensive service - from presentation of possible solutions, through implementation of software and training of personnel, to technical support provided during the entire period of functioning of the implemented software.

We specialize in development of dedicated software that is tailored to the needs of customers and in IT consulting, but also in outsourcing of IT services, provision of IT support services both for the SME sector and large corporations.

First of all, our success is determined by excellent knowledge of up-to-date IT technologies and profound understanding of business needs of present-day organizations.

Our company is characterized by its international reach. This is proved by the fact that since the establishment of the company, we have successfully managed to enter into regular cooperation with many large and medium-sized companies not only from Poland, but also from Germany, Switzerland, Austria and UK. Our relations with companies are based on partnership and aim at long-term cooperation.

We invite you to get acquainted with our offer and to use our services.

Yours faithfully,
Proprietors of Solsoft

Bartosz Forysiak   Adam Kaczmarz

What we do:

We offer IT support at each stage of system development, providing comprehensive service for the solutions being implemented and high flexibility in relation to changing customer needs that result from dynamic market conditions.

Our services include:

Project consulting
We assist our customers in selection of the most optimal method, technology and project strategy. We offer our assistance by presenting possible solutions and strictly controlling their influence on execution of the goal set forth by a company.

Designing
We specialize in development of widely understood Internet applications. The dedicated applications designed and developed by us are mainly web applications (intranet or Internet applications), but they can also use alternative interfaces (mobile applications, desktop applications).

Testing and implementation
We test the software developed by us with respect to functionality and efficiency, which also includes preparation of technical and user documentation. We spare no effort to make the solutions, which have been designed and implemented by us, highly efficient, reliable, as well as easy and comfortable in use.

Training and technical support
The basis for success of each project is the ability to handle it, and therefore we offer intensive training courses for personnel. We also provide technical support during the entire period of functioning of the implemented software.

Competences:

The value of a company is determined by the scope of knowledge and experience of the specialists working in the company. Apart from know-how itself, the ability to implement each project requires also other important competences, of which our team of professionals can boast.

Business competence

Our long-term experience in consulting, designing, and implementation of IT systems allows us to provide our customer with professional assistance at each stage of a project. We provide not only complete support in IT areas, but we also help realize business goals of companies and institutions by giving them the following tools that streamline their work and contribute to an efficiency increase: B2B solutions (online services), B2C solutions (e-commerce), business intelligence, e-business (e.g. CRM), e-community, enterprise application integration (EAI), and others. Besides, having rich experience in implementation of EU projects and cooperating with leading edge companies that deal with EU consulting in Poland, we provide our customers with comprehensive subject-related, economic & financial, and design & implementation services in the scope of EU funds concerning investments in IT technologies.

Our strengths

Methodological competence

An important element of each project, which determines its success, is selection of adequate management methodology. When developing software, we use agile development and test-driven development methodologies, which guarantee high quality of our services and allow fully adjusting the software to customer's requirements.
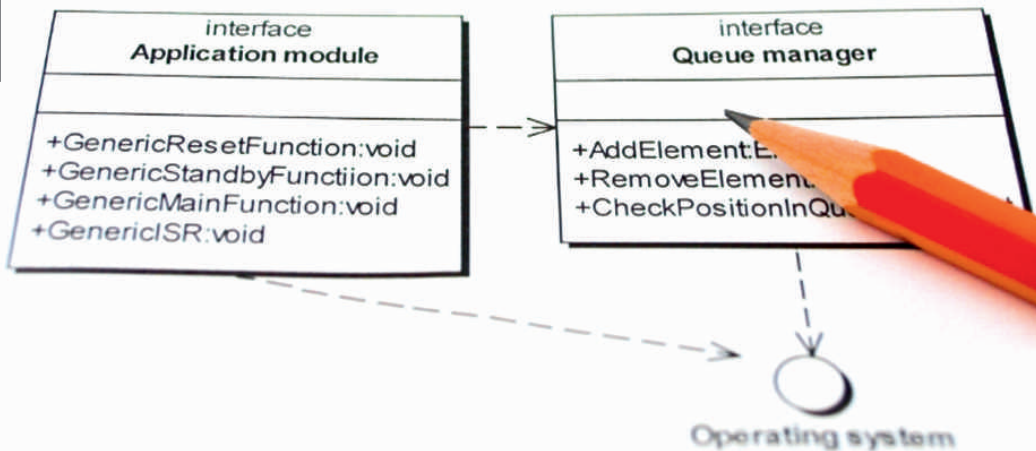

Technological competence

The diversity of projects requires use of different IT technologies. We develop widely understood Java-based Internet applications, particularly with the use of up-to-date web and server technologies (i.e. Java Enterprise, Ajax, Struts 2, JSF, Spring/Spring MVC, GWT, Hibernate, Lucene, web services and many others), which combine aesthetics with functionality. We integrate IT systems and extend the existing platforms by adding new functionalities.

Social competence

The basic rule we follow in our day-to-day work is development of quality, which has a direct influence on increasing the confidence of our customers. We are of the opinion that each IT project must be successful, if the people making up the team working on the project understand each other, are full of enthusiasm and want to dedicate some extra time to create high quality products.

The ability to combine competences allows our team of highly qualified programmers to manage even the most advanced IT projects.
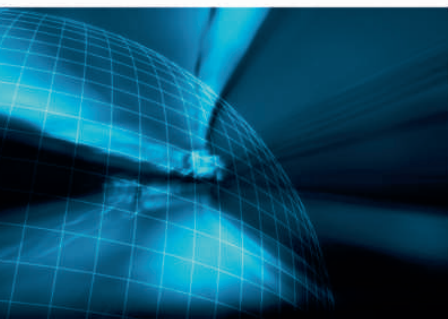

Our offer

IT solutions:

By carrying out many projects for our Customers, we gained rich experience in the scope of design and implementation of advanced IT technologies and solutions.

Our offer includes, among other things:

- E-commerce solutions: specialized and highly-efficient Internet shops, Internet markets, sales systems, Internet payments
- Intranet systems assisting management of a company
